Abstract: The sustainable architecture is one the key areas of research in the architecture and urban planning. In this paradigm, the architecture is designed and implemented with the focus of the environmental factors. The sustainable architecture keeps track of the environment factors and makes sure that the architecture should be resistant to the natural calamities. The sustainable architecture avoids the negative impacts of the environment on the buildings and town planning objects to have the long life of project. This study underlines the aspects of sustainable architecture with the particular focus in Iraq. With the sustainable development, not only the human growth is concerned but the huge elevation in the national economy is implemented because once the buildings are made with higher lifetime with minimum maintenance, there will be minimum loss and higher efficiency in the natural environment. In addition, the sustainable or green architectures provide the good environment and weather to the citizens that improve their health and minimum expenditures on the medical aspects will be there. The sustainable architecture in Iraq is under implementation with all these points in the consideration, so that, higher efficiency in the work can be obtained. The sustainable architecture is adopted with the renewable resources to have the higher level of optimization in the resources and overall logistics. This manuscript underlines the assorted dimensions and perspectives on the self made homes and the architectures that is integrated and associated with the sustainable architecture.

Key words: Case scenarios of sustainable architecture in Iraq, self made architectures, self made homes, sustainable architecture, sustainable architecture in Iraq, sustainable development

INTRODUCTION

Sustainable architecture (Mahdiraji *et al.*, 2018; Guy and Farmer, 2001; Minke, 2012) is engineering that looks to limit the negative ecological effect of structures by productivity and balance in the utilization of materials, vitality and advancement space and the biological community on the loose (Zolfani *et al.*, 2018; Fuchs *et al.*, 2008s). Sustainable engineering utilizes a cognizant way to deal with vitality and natural protection in the plan of the manufactured environment Fig. 1.

The possibility of supportability or environmental outline is to guarantee that our activities and choices today don't hinder the chances of who and what is to come.

A few cases of sustainable building materials incorporate reused denim or blown-in fiber glass protection, economically collected wood, trass, linoleum, sheep fleece, concrete (high and ultra high performance roman self-mending concrete), boards produced using paper chips, prepared earth, smashed earth, mud, vermiculite, flax limen, sisal, see grass,

Fig. 1: Sustainable architecture

extended mud grains, coconut, wood fiber plates, calcium sand stone, privately got stone and shake and bamboo, which is one of the most grounded and quickest developing woody plants and non-lethal low-VOC pastes and paints. Vegetative cover or shield over building envelopes additionally, helps in the same. Paper which is created or produced out of backwoods wood is as far as anyone knows 100% recyclable. Accordingly, it recovers and spares all the timberland wood that it takes amid its assembling procedure (Ng and Shahzad, 2018).

MATERIALS AND METHODS

Key points of the sustainable architecture:

- Usage of sustainable energy
- Integration of renewable energy
- Recycled materials
- Lower volatile organic compounds
- Waste management

Sustainable architecture in Iraq: Iraq is one of the leading countries focusing on the sustainable development and the design of sustainable architectures. From a research report, the self designed homes which are based on the classical architecture of Iraq are proposed to be the solution for the housing crisis in Mosul (Casey, 2017) (Fig. 2).

The sustainable architecture is more diverted towards the prolonging of the aging in the buildings and towns, so that maximum lifetime can be achieved in the country without any damage. The Kurdistan region is having enormous initiatives whereby the sustainable architectures are integrated (Zebari and Ibrahim, 2016) Fig. 3-6. In Kurdistan, following are the key features implemented for the sustainable architectures:

- Selection of materials
- Insulating the wall sections
- Effective construction mechanisms
- Shading, orientation and ventilation

Fig. 2: Self design homes in Mosul

Fig. 3: Model of the sustainable architecture

Fig. 4: a-f) Adoption of sustainable architectures in Basra

Fig. 5: Sustainable architecture in Basra

Fig. 6: Shanashel

- Cost effectiveness
- Using plastic water tanks with replacement of zinc water tanks

Basra, Iraq is a growing area for art, sculpture and architecture. Basra is another city in Iraq that is making use of sustainable architectures in the residential as well as commercial buildings. The buildings are created, so that, there is shadow to support the air and natural environment. In addition, the usage of bricks, iron struts and windows are associated with the relation to the natural environment.

RESULTS AND DISCUSSION

Impact of architectural aspects in development of Iraq:

There is huge positive impact of the sustainable architecture in the overall development of Iraq. To cope up with the natural calamities like storm, escalated temperatures, earthquakes, the town planning and architectures are getting reviewed to save the human life and for prolonged age Fig. 7 and 8.

Aggregation method for the sustainable architecture scoring:

$$P_{ENV} = \sum_{i=0}^n I_{ENV} \cdot W_{ENV}$$

$$SS = P_{env} \cdot W_{env} + P_{soc} \cdot W_{soc} + P_{eco} \cdot W_{eco}$$

Fig. 7: View of the architecture in traditional buildings

Fig. 8: Modernized view of the architecture in current buildings

Where:

I = Environmental factor

W_{env} = Weight

P_{env} = Performance in environment

There are multiple findings and extracts from the researcher of different researchers in this domain. Following are the excerpts. The research by Ayyash (2015) associates the integration of vernacular

architecture as the sustainable development in the buildings and towns of Iraq. The research presents the case study with multiple perspectives. The main aim and objective of the study is to find out and gaps in the architecture designs in Iraq with the suggestive measures.

The excerpts by Norton (1999) presents the sustainable development with the specific case studies in different countries. The presents the architecture that is gender specific and sensitive towards multiple locations.

Safaei (2009) gives the sustainable architecture titled SHAHADAT with the case scenario of Dezful in the country Iran. The proposed research presents the underground architecture that was given name SHAHADAT with the relative features.

Al-Thahab *et al.* (2014) presented the social space with the privacy concerns in the novel architectures of Iraq. The detailed view of the historical as well as the current architectures are presented in this researcher. There are enormous advantages of using sustainable designs and architectures:

- Economic benefits
- Energy optimization
- Community and health benefits
- Elevation in the nation's resources
- Optimization of natural resources

Sustainability and urban heritage: The urban heritage is required to be associated with the sustainability, so that, the overall architecture can be retained to higher lifetime. In addition, the overall lifetime of the architecture is also dependent on the type of design and the components used in the system. The sustainable architecture makes sure that the reusable or renewable resources can be integrated with the elevated level of performance and the lifetime with the enhanced values in the system.

CONCLUSION

With the increasing scenarios of natural calamities and disasters, there is need to adopt a highly effective mechanism that can save the human life and nation's infrastructure, so that, the overall economy can be escalated. The sustainable architecture is one the key regions of research in the architecture and urban arranging. In this worldview, the architecture is composed and executed with the focal point of the natural elements. The sustainable architecture monitors the earth factors and ensures that the architecture ought to be impervious to the normal cataclysms. The sustainable architecture

maintains a strategic distance from the negative effects of nature on the structures and town arranging articles to have the long existence of task. This study underlines the parts of sustainable architecture with the specific concentration in Iraq. With the sustainable improvement, the human development is worried as well as the gigantic height in the national economy is actualized on the grounds that once the structures are made with higher lifetime with least upkeep, there will be least misfortune and higher proficiency in the indigenous habitat. Also, the sustainable or green architectures give the great condition and climate to the subjects that enhance their well being and least uses on the medicinal viewpoints will be there. The sustainable architecture in Iraq is under usage with every one of these focuses in the thought, so, higher productivity in the research can be acquired. Iraq is having many projects with the sustainable architectures, so that, the overall aging of buildings and towns can be improved to highest time span.
