---

**Abstract:** The aim of this study is to explore the relationship between workforce agility and organizational intelligence (considering the components of both concepts and contextual variables, too). The population included the managers and employees working at the grade one companies of Iran High Council of Informatics. Results showed a significant positive correlation between workforce agility and organizational intelligence. All components of organizational intelligence (except strategic vision) had a positive significant relationship with workforce agility. The relationship between the individual components of workforce agility (except interpersonal adaptability) and organizational intelligence is positive and significant. Variables of age, work experience and organizational position had a positive significant relationship with the agility of the workforce while about sex and educational level, no significant relationship was found. It is recommended simple and operational translation of mission statement and strategies for employees, establishing of feedback system, enhancing of employees work-life quality and participation, facilitating learning, managerial skills training, putting employees in decision-making situation, taking advantage of the cultural diversity, be considered. Moreover, employment of professionals (regardless of gender or merely emphasis on educational degree) must be considered.

**Key words:** Organizational intelligence, workforce agility, strategic vision, age, degree

---

### INTRODUCTION

New product development companies make their business by continuously introducing new, innovative products. In the current global, turbulent market environments these companies face many source of uncertainty (Kettunen and Laanti, 2008). In this research, the focus was on the ICT companies. ICT has been faced with dual challenges of the rise and collapse of industry boundaries. Characteristic of this industry is fast change and also complex systemic interactions (Doz and Kosonen, 2008).

It's clear that in a rapidly changing world, only intelligent organizations survive and the efficiency of organization is proportional with the usage of their fulfillment depends on their intelligence requirement (Ercecin *et al.*, 2011). Organizational Intelligence (OI) is a multidimensional and multifaceted concept involving the recursive interplay of cognitive, behavioral and emotional capabilities of organizations (Akgun *et al.*, 2007) to shape and change the environment and to adapt to its

environment (Akgun *et al.*, 2007). Thus, organizational intelligence is not separate from the people who compose it and live in it (Akgun *et al.*, 2007). In intelligent organization employees put their heads together to milk opportunities, co-create products and services, find and solve problems (Pinchot and Pinchot, 1996).

Now a days many new product development software project employ agile methodologies (Kettunen and Laanti, 2008). Successful and effective integration of new technology requires the workforce to adapt to changes in their workplace at a much faster pace than in the past (Harvey *et al.*, 1999). Furthermore, Yaghoubi and Dahmardeh argued workforce as a content enabler of organizational agility. Workforce Agility (WFA) is commonly described as a strategy that facilitates profitability in rapidly changing and uncertain production environments. It is widely believed that workforce agility may provide wide range of benefits such as quality improvement, better customer service, learning-curve acceleration, economy of scope and depth (Sherehiy *et al.*, 2007).

There are a few researches investigating WFA and moreover, most of these researches have focused on the attributes of the agile workforce and not the factors influencing WFA or the factors influenced by it. So, considering common aspect of WFA and OI, i.e., the ability to recognize environmental opportunities and threats and to response to them, researchers supposed that cognitive, emotional and behavioral aspects of OI could facilitate agile behavior and on the other hand, WFA could enhance level of OI. Because so far no research investigate the relationship between these two variables, researchers consider these variables both predictor variable and dependent variable. In addition, there's no research investigating relation of demographic variables and WFA. Researchers hope the research findings would help better understanding of the relation between OI (as an organizational level of environment assessment and responsiveness) and WFA (as an individual level of adaptability) and accordingly, improving both of them.

The aim of this study is to explore the relationship between workforce agility and organizational intelligence (considering the components of both concepts) and also explanation of the relationship between contextual (demographic) variables and workforce agility. Researchers established this research according two subjective backgrounds: a conceptual similarity between OI and managerial actions for making employees agile and the possibility of agile workforce role to enhance organizational intelligence level.

The questions of this research are: Is there a significant correlation between workforce agility and organizational intelligence? (the main question) Does workforce agility predict the level of organizational intelligence? Does OI predict the level of WFA? Because so far no research investigate the relationship between these two variables, researchers consider these variables both predictor variable and dependent variable. Is there a significant correlation between WFA and each of the components of OI? Is there a significant correlation between OI and each of the components of WFA? Is there a significant relationship between demographics variables and WFA?.

**Theoretical background:** The conceptual definition of workforce agility is based on Breu concept analysis in which they defined WFA as environmental responsiveness in the context of turbulence and change. WFA is an organization's ability to rapidly respond and flexibility cope with the unexpected internal and external environmental changes. Matsuda define OI as the combination of individual intelligence and machine intelligence.

Intelligence and competency were identified as constituting the strongest indicator of WFA. Intelligence involved collective environmental responsiveness of a workforce and its ability to interpret external changes to adjust appropriately and rapidly. Breu defined competency in relation to information technology and software use business and management integration process skills and alignment with the organization's direction. In the model by Sherehiy is presented, workforce agility is considered as an agile performance or a observable behavior at research which are defined in following six main dimensions include.

**Dealing with unpredictable and uncertain situations:** Key aspects of performance that relate to such events are how easily workers adjust to and deal with the unpredictable nature of these situations, how efficiently and smoothly they can shift their orientation or focus when necessary and to what extent they take reasonable action in spite of inherent uncertainty and ambiguity in the situation (Pulakos *et al.*, 2000).

**Creative problem solving:** It refers to solution of novel, ill defined and complex tasks and change related problems and also refers to initiate the activities help solving problems. On the other hand, this aspect of performance requires the individual to bring complex matters or situation to their desired end or develop creative solutions to novel, difficult problems (Pulakos *et al.*, 2000).

**Professional flexibility:** Ability and competence of working on different tasks in different teams simultaneously.

**Learning work tasks and procedures:** Learning new ways to perform a job, tasks; learning new skills set or tasks to retool a job or a new career.

**Interpersonal adaptability:** Aspects of interpersonal adaptive performance that have been discussed in the literature include such things as demonstrating interpersonal flexibility; adjusting interpersonal style to achieve a goal; adapting interpersonal behavior to work effectively with a new team, co-workers or customers and being a flexible, responsible service-provider who can effectively anticipate and fulfill customer needs (Pulakos *et al.*, 2000).

**Coping with work stress:** Stress is an English word meaning pressure and force (Askari, 2011). Work stress often occurs when individuals' physical and emotional do not match or cannot handle their job

demands, constraints and/or opportunities (Ismail *et al.*, 2009). In this literature, coping with stress means the abilities of handling stressful and hard situations at research.

Albrecht (2003) in his book named “the power of mind at work” defined organizational intelligence as a capacity of an organization to mobilize all of its brain power and focus that brain power on achieving the mission. Accordingly, he presented a organizational intelligence model composed of 7 elements as follows.

**Strategic vision:** Strategic vision refers to the capacity to create evolve and express the purpose of the enterprise (Nasabi and Safarpour, 2009). This means a feasible plan for leading an organization towards its main goals (Kordestani *et al.*, 2013). Shahraki *et al.* (2011) believes that organizations make an attempt for change priorities, strategic vision and their traditional models in order to adapt with turbulent and volatile market.

**Shared fate:** When all or most of the people involved in the enterprise including associated stakeholders like key suppliers and business partners and in some cases even the families of its members, know what the mission is have a sense of common purpose and understand their individual parts in the algebra of its success, they can act synergistically to achieve the vision, this sense that researchers are all in the same boat creates a powerful sense of community. Without a sense of shared fate, the psychological tone of the culture degenerates into a look out for number one spirit (Nasabi and Safarpour, 2009).

**Appetite for change:** In smart organization, change represents challenge, opportunity for new and exciting experiences and a chance to tackle something new. People in these environments see the need to reinvent the business model as a welcome and stimulating challenge and a chance to learn new ways of succeeding (Nasabi and Safarpour, 2009).

**Heart:** The element of heart involves the willingness to give more than the standard. Organizational psychologists refer to discretionary effort as the amount of energy the members of the organization contribute over and above the level they have contracted to provide (Nasabi and Safarpour, 2009).

**Alignment and congruence:** Any group of more than a dozen people will start bumping into one another without a set of rules to operate by. They must organize themselves for the mission, divide up jobs and responsibilities and work out a set of rules for interacting with one another and for dealing with the environment. In

the intelligent organization the system, broadly defined, all come together to enable the people to achieve the mission (Nasabi and Safarpour, 2009).

**Knowledge deployment:** More and more these days, enterprises succeed or fail based on the effective use of knowledge, information and data. Knowledge deployment deals with the capacity of the culture to make use of its valuable intellectual and informational resources. OI must include the free flow of knowledge throughout the culture and the careful balance between the conservation of sensitive information and the availability of information at key points of need. It must also include support and encouragement for new ideas, new inventions and an open-minded questioning of the status quo (Nasabi and Safarpour, 2009). According to Dove, agility represents management’s capability for effective applying of knowledge (Shahraki *et al.*, 2011).

**Performance pressure:** It’s not enough for executives and managers to be preoccupied with the performance of the enterprise. In the intelligent organization, everyone owns the performance proposition, the sense of what has to be achieved and the belief in the validity of its aims. Leaders can promote and support a sense of performance pressure but it has the most impact when it is accepted by all members of the organization as a self-imposed set of mutual expectations and an operational imperative for shared success (Nasabi and Safarpour, 2009). The proposed conceptual framework of the research as shown in Fig. 1 implies the existence of a relationship between WFA and OI.

A few researchers have studied factors influencing on workforce agility. These factors are: employee involvement practices, e.g., information sharing, training, reward and power sharing (Sumukadas and Sawhney, 2004); workforce management practices (Kathuria and Partovi, 1999); work organization and agility strategy; workers’ cross-training (Hopp and Oyen, 2004) and

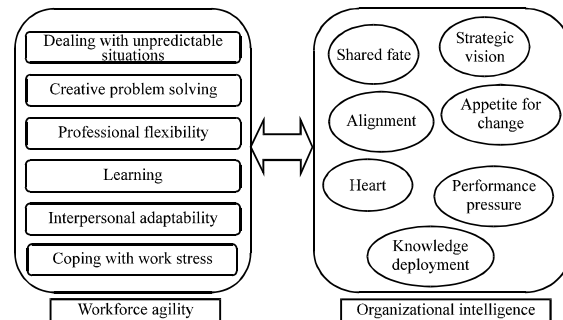

Fig. 1: The conceptual model of the relation between WFA and OI

internal factors (Personality, experience/knowledge and abilities) and external factors (Input, mechanism, output and constraint) investigated by Harvey *et al.* (1999). Organizational practices create the possibility to align or complete individual competencies to the business need of being agile. In addition among new working models, the strongest association with workforce agility was found for virtual teams within and across organizations and communities of practices (Sherehiy *et al.*, 2007). However, there's no research that investigated the relationship between WFA and organizational intelligence. About the other demographic variables (e.g., age, sex, organizational position and education level) no previous research was found.

**MATERIALS AND METHODS**

The sample consist of all 207 managers and employees working at each seven companies of Iran high council of informatics established in Province Tehran which awarded No. 1 grade at the both fields of customer-order software development and presentation and support of domestic software packages and information files because of the dynamic environment such companies are in. Three types of questionnaire was used for data collection include: the five point likert scale organizational intelligence questionnaire of Albrecht and Workforce agility questionnaire of Sherehiy and a questionnaire for gathering demographic data (sex, age, experience, organizational status and education). Total of 207 questionnaire packages were distributed in person. Finally, 154 questionnaire packages were returned and 144 of them distinguish as useful and included. The data was analyzed using SPSS Software package. Reliability of data-gathering tool was measured by Cronbach's coefficient Alfa (0.968 for the OI questionnaire and 0.877 for the WFA questionnaire). Normality of data was confirmed by One-Sample Kolmogorov-Smirnov test. Pearson correlation coefficient, regression, independent t-test and Analysis of Variance (ANOVA) was used to answer the questions of the research.

**RESULTS AND DISCUSSION**

The result of the data analysis to answer the questions is as follows:

- 1st and 2nd questions: regression analyze was used to answering these questions. These following regression equation was established between OI and WFA

$$Y = 89.90 + 0.55X \text{ (X = WFA, Y = OI)}$$

This means that adding one point to workforce agility, organizational intelligence score will increase by as much as three points, so researchers can claim that this regression is linear:

$$Y = 114.27 + 0.14X \text{ (X = OI, Y = WFA)}$$

The above equation means that adding one point to organizational intelligence, workforce agility score will increase by as much as three points. So, this regression is linear:

- 3rd question: using pearson correlation coefficient, revealed the correlation between WFA and OI is positive and significant (Table 1)
- 4th question: examining to answer this question indicated the correlation between WFA and OI components (except strategic vision) is positive and significant (Table 2)
- 5th: in Table 3, the results of pearson correlation reveal that all obtained sig. are <0.05 (expect the sig. related to interpersonal adaptability) therefore, data analysis indicated the relationship between WFA components and OI (except interpersonal adaptability) is positive and significant
- 6th: concerning age and WFA, the obtained results of pearson correlation indicate that correlation coefficient is equal to 0.197 and sig. = 0.019. Regarding to the fact that sig. = 0.019 < 0.05, therefore a significant positive relationship between age and WFA is confirmed (Table 4). Moreover, this table show that pearson correlation coefficient about experience and WFA is 0.259 and sig. = 0.002. Hence, researchers can confirm a positive significant relationship between these two variables

Also, in Table 5 and 6, t-test indicated the difference of WFA between gender groups is not significant. Because the obtained sig. is >0.05 (0.059 > 0.05). As researchers can see in Table 7 and 8, the t-test indicated

Table 4: Correlations between two demographic variables (age, work experience) and WFA

Variables	Age	Experience	Workforce agility
<b>Age</b>			
Pearson correlation	1.000	0.896**	0.197*
Sig. (2-tailed)	-	0.000	0.019
N	142.000	142.000	142.000
Sig. (2-tailed)	0.000	0.000	0.270
N	142.000	142.000	143.000
<b>Experience</b>			
Pearson correlation	0.896**	1.000	0.259**
Sig. (2-tailed)	0.000	0.000	0.002
N	142.000	142.000	142.000
<b>Workforce agility</b>			
Pearson correlation	0.197*	0.259**	1.000
Sig. (2-tailed)	0.019	0.002	-
N	142.000	142.000	144.000

Table 5: Variable sex: group statistics

Variables	Sex	N	Mean	SD	SEM
Workforce agility	Man	92	139.5644	16.25603	1.69481
	Woman	50	134.1534	15.94189	2.25452

the sig. (0.45) is <0.05, therefore difference of agility between managers and employees is significant ( $\alpha = 5\%$ ).

In Table 9, it can be seen that obtained sig. is higher than 0.05 (0.964>0.05). Accordingly, the analysis tables of ANOVA, demonstrated difference between three groups of education degree in terms of agility is not significant (Table 9 and 10).

As identified earlier, the regression quotation indicated that organizational intelligence is a significant predictor of workforce agility and vice versa. So, it's recommended to promotion level of WFA and OI components. In this regard, establishing of feedback system for employees, enhancing of employee work-life quality and participation, facilitating learning with applying of various techniques is suggested. To enhance HR flexibility internally, firms can develop employees with a wide range of skills and behavior repertoires through training or job rotation (Wu, 2010). Thus, managerial skills training, putting employees in decision-making situation along the career path, taking advantage of the cultural diversity of employees with communication skills training and elimination of emerging field of destructive conflict should be considered.

As previously mentioned, no relationship was found between diffusion of strategic vision among personnel and WFA. According to Darbi (2012), it is proposed the components of mission and vision statements be broken down into measurable or proxies of desired outcomes so employees can be schooled in them. In addition, the perception that mission and vision statements are solely meant for management or leadership is very rife amongst employees though they appreciate their importance to the institute. It is thus necessary to identify ways to disabuse their minds and inculcate a better sense of ownership in them. Finally, since ownership is a prerequisite for impact, management's main area of focus must be towards getting employees to see and appreciate the mission and vision statements as theirs because the study shows that making them aware of the existence of the statements is just one step towards getting the needed impact on their attitudes to perform in a intelligent organization.

As mentioned before, a positive relationship was found between coping with stress and OI. Woods believes stress may cause different problems in people as follows: lack of mental health, lack of bodily health and reduction of efficiency, e.g., job dissatisfaction, Absence, reduction of output and generally reduction of work level (Askari, 2011). Coping with stress, one can prevent these harmful results to act more intelligent.

In this research, the relation between learning and organizational intelligence was proved. So, substructure and processes required for learning should be developed. It's observed that by promotion of personnel knowledge, organizations intelligence and productivity are increased (Koupahi *et al.*, 2013).

Matsuda defines OI as the intellectual ability of an organization for solving its problems (Kordestani *et al.*, 2013). Confirming this definition, the result of this research showed a positive relationship between problem solving ability (as one of the agile workforce attribute) and IO.

Table 6: Examining relationship between sex and WFA: independent samples test

### CONCLUSION

There's no empirical study on demographic variables effect on WFA before. Harvey *et al.* (1999) believe work experience is related to WFA. The findings demonstrate this belief. About variable age, the older individuals are, the greater agility to be seen. It can be in relation with promotion of work experience along with aging. Concerning organizational position, as might be expected, agility of managers significantly was higher than the other employees. Commonly, a manager plays three kind of roles, e.g., an interpersonal role, an informational role and a decisional role (Mintzberg, 1973). In this regard, Katz (1974) identified three managerial skills that are essential to successful management: technical, human or relational and conceptual. It's obvious managers need to

be more agile than theirs employees to perform these roles. Finally, no relationship between gender and WFA or education level and WFA was found. According to what mentioned above about demographic variables, employment of professionals (regardless of gender or merely emphasis on educational degree) is recommended.
