Catalogue for Malaysian Cryptinae (Hymenoptera: Ichneumonidae)

A. Nur Azura and A.B. Idris

School of Environmental and Natural Resource Sciences, Faculty of Science and Technology,
University Kebangsaan Malaysia, 43600 UKM Bangi, Selangor, Malaysia

Abstract: Fifty eight species and one subspecies of Cryptinae were recorded in Malaysia, consisting of 31 genera. The type specimens were deposited in various depository centers.

Key words: Cryptinae, Ichneumonidae, catalogue, hymenoptera

Introduction

Cryptinae is the largest subfamily of Ichneumonidae (Hymenoptera) which comprises of more than 300 species worldwide. It can be found in mostly all kinds of habitats in the world. Typically they are parasitic in cocoons of the Lepidoptera, sawflies, braconids, ichneumonids and Neuroptera. Some of them attack egg cocoons of spiders and pupae of Diptera. The most common feature to distinguish a cryptine is the sternaulus. It is usually more than half as long as mesopleuron, often reaching the hind edge of mesopleuron. The second recurrent vein is always present in almost all species. First abdominal segment slender, or sometime of moderates proportion. Glymma always lacking.

In this paper we present a catalogue of Malaysian Cryptinae deposited in several repository centers all around the world. They are type specimens described from Malaysia. We also include 5 'non-type' specimens but were recorded in Malaysia. They are *Amauromorpha accepta* Tosquinet, *Diatora lissonota* (Viereck), *Diatora prodeniae* Ashmead, *Paraphylax rubriornatus* Cameron and *Austriteles armatorius* Gauld. *Sketia brookeana* is also included although the type was described from Indonesia. The reason is because its junior synonym, *Sketia nigripina*, was described from Malaysia. The aim of this paper is to prepare a catalogue of malaysian cryptine and it is hope to be very useful information for the taxonomists who are interested to study them (Yu and Horstmann, 1992).

Each citation shows the valid species or subspecies name, followed by the name of author and the year of the first description. The reference quoted is the original description of the species. Type specimen information are listed in the following order: type location by country and if available by states or exact locality, type depository and sex of the type.

The code for the type depository is as listed:

Code	Institute
ATL-CBR-ANIC	Australian National Insect Collection, Canberra, Australia.
BGM-BXL-IRSN	Institut Royal des Sciences Naturelles de Belgique, Entomologie, Rue Vautier 29, B-1040 Bruxelles, Belgium.
HGR-BDP-TMA	Termeszettudomanyi Muzeum Allattara, Barossa-Utea 13, Budapest H-1088, Hungary.
UKD-LDN-NHM	The natural History Museum, Department of entomology, Cromwell Road, London, England, SW7 5BD, United Kingdom.
UKD-OFD-HOPE	Hope Entomological Collection, University Museum, Oxford, England, OX1 3PW, United Kingdom.
USA-GVL-GUPTA	Entomology and Nematology Department, University of Florida, Gainesville, Florida, 32611, USA (V.K. Gupta collection).
USA-WST-USNM	U.S. National Museum of Natural History, Smithsonian Institute, Washington, DC, 20560 USA.
ITL-GNA-MSCN	Museo Civico di Storia Naturale, Via Brigata Liguria 9., Genoa, Italy.
